

Jerimum Baixo				
This gold-in-soil anomaly located approximately 1km south of Jerimum Cima covers an area approximately 700 x 500m in size. Historic garimpo workings are located on the SE edge of the anomaly and stockwork and sheeted vein mineralization have been mapped at this location. Surface sampling of these workings returned 8m @ 5.0g/t Au and 42m @ 1.0g/t Au. A single previous drill hole completed by Magellan intersected 1.9m @ 3.1g/t Au. The bulk of the anomaly however remains untested.

* All holes were drilled at -50°. Dips of the intersected structures are not known, and intersection widths are not necessarily true widths				
** Results are pending on holes 132 and 134
